

Multimedia

Summary

Images

We explored how images made the web better, by giving visual aesthetics and breaking the wordy nature.

1. Image Syntax - It requires two attributes to work properly. `src` and `alt`
2. File Path - the `src` points to the location of the image file.
 - a. The value of the URL can be relative or absolute.
 - b. Files can be in the same directory, subdirectory or externally hosted
3. Alternative text - This is used to describe the context of the image. It is very helpful when the image cannot be seen by the user or browser
4. Width and Height - attributes that can be specified for the image to fill up allocated space.
5. Introduced the concept of Content Delivery Network
6. Practiced how to use the `img` element in our code

Audio & Video

These two elements are quite similar with the syntax but use different files.

1. They both require multiple sources - as there seems to not be a one file type that suits all browsers.
2. The `source` indicates the use of multiple options
3. You must provide the controls on both elements, this would give the user the ability to handle playback and pauses.
4. Using a paragraph to provide alternative text in the case file is missing
5. It can be quite daunting having to find different files for the same content, this is where Online Video and Audio Providers come in.
6. Practiced how to embed videos and audio from an Online provider.

Tools

1. Codepen or Vs Code
